Summary

Junior Full-Stack Software Engineer focused on mobile and backend development, with 2+ years of experience in software development and applied research. Experienced in building end-to-end applications, automating tests and deployments, and improving software reliability.

Education

Federal University of Sergipe, UFS | *January 2020 - January 2027*
Bachelor's in Computer Engineering

Experience

Full Stack Developer, Ajudai | *December 2025 - March 2026*

- Built a React Native (Expo) and Spring Boot mobile MVP for pilot launch, delivering five core flows (authentication, campaign creation, donations, donation history, and voucher creation/recovery) and 63 end-to-end regression scenarios for those flows using Maestro for UI automation and WireMock for API mocking, improving release stability and troubleshooting efficiency.
- Eliminated a single point of failure in the payment flow by designing a multi-provider failover system, increasing availability from 0% to ~99% during provider outages.
- Reduced deployment time by 75%, from 1 hour to 15 minutes, saving ~1.5 SWE/h per week across 2 weekly releases, by implementing CI/CD with GitHub Actions and Terraform-managed AWS infrastructure.

PIBIC Scientific Initiation Student, UFS | *July 2023 - August 2025*

- Built a plagiarism-detection benchmark dataset by scraping Codeforces problems and solutions via a custom Python pipeline with parsing and retry logic, addressing the lack of reliable validation data in the literature, and assembling 500 solutions to distinct problems and generating obfuscated variants.
- Implemented a Python-based Tree-sitter converter to generate reversible syntax-tree JSON representations for automated code comparison, achieving same-language plagiarism-detection F1-scores of 86.36% for Python and 68.63% for C with the dataset.

Projects

LLM Router Module | *February - March 2025*

- Won 2nd place at the ChipLabs Hackathon for building an LLM routing module for multiple AI APIs using LangChain and PostgreSQL as a vector database, reducing inference cost by routing prompts to the smallest adequate model instead of a fixed default.

SBC Programming Marathon Coaching | *July 2025 - present*

- Achieved 63rd place out of 984 teams in the SBC 2025 Programming Marathon by coaching the team through structured problem-solving sessions, contest simulations, and targeted practice on algorithmic weaknesses.

Skills

- **Programming languages:** Python, TypeScript, Java, C#
- **Frontend:** React, React Native (Expo), Next.js
- **Backend:** Spring Boot, .NET, FastAPI, NestJS
- **Infra:** AWS, Docker, Terraform, GitHub Actions
- **Databases:** PostgreSQL, MongoDB, SQLite
- **Languages:** Portuguese (native), English (C2), French (A2)
